A4i (The App4Independence) is a validated mobile app and clinical portal to improve outcomes for people with severe mental illness.

A platform that connects patients to each other and their care-teams, A4i utilizes patent-pending features (audio hallucination detection) and artificial intelligence / machine learning to identify risk of relapse and readmission. A4i has undergone continuous development and [validation across various clinical contexts](#), including randomized controlled trials and peer support clinics.

The most substantial improvements in clinical outcomes have been observed in peer support settings.

- Proactive risk detection, long-term engagement with patient populations
- Improved peer support relationships, awareness and response times
- Immediate and on-going feed-back loops and communications

 Peer Support
 / Patient
 Engagement

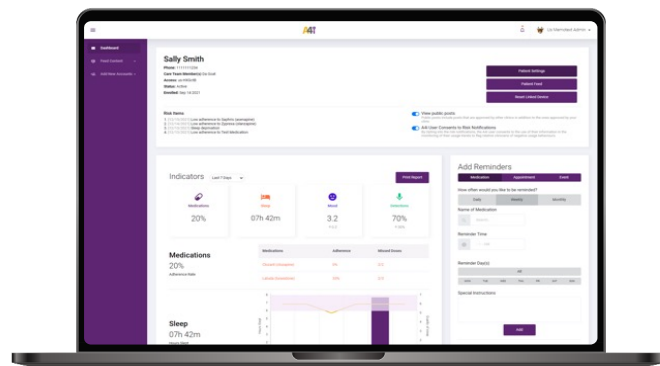

A4i allows individuals to connect and safely/anonymously interact, fostering relationships amongst individuals with lived experiences and helping patients feel more comfortable with their symptoms and diagnosis.

Many features of the A4i app and portal enable proactive clinical decision support. For example, flagging risky content and frequent check-ins on the portal allows clinicians to check in on clients posting content indicating poor mental health,

Program Features:

- + Patient/Clinician co-designed
- + Secure/HIPAA compliant social community feed
- + Patent Pending Auditory Hallucination Detection
